

1.6 Applications of Linear Systems: dvt Problems

Some strategies:

1. Identify what the question wants. This may tell you one or both of your variables.

2. Remember $d = v t$

3. Use a table to fill in known and unknown values to help form your equations.

4. Make sure your units are all consistent.

Ex.1. Alex drove 500 km from Ottawa to Toronto in 5 1/2 h. He drove part of the way at 100 km/h, and the rest of the way at 80 km/h. How far did he drive at each speed?

	distance (d)	speed (v)	time (t)
Trip 1	x	100	$\frac{x}{100}$
Trip 2	y	80	$\frac{y}{80}$
Total	500	—	5.5

$\textcircled{1} x + y = 500$
 $\textcircled{2} \left(\frac{x}{100} + \frac{y}{80} \right) = 5.5 \times 8000$
 $8x + 10y = 44000$
 $8x + 10y = 4400$
Isolate $\textcircled{1}$
 $x + y = 500$
 $x = 500 - y$
Sub $\textcircled{1}$ into $\textcircled{2}$
 $8(500 - y) + 10y = 4400$
 $4000 - 8y + 10y = 4400$
 $2y = 4400 - 4000$
 $2y = 400$
 $\frac{2y}{2} = \frac{400}{2}$
 $y = 200$
Sub $y = 200$ into $\textcircled{1}$
 $x + y = 500$
 $x + 200 = 500$
 $x = 300$
 \therefore

Ex.2 Emily travelled 95 km from Oakville to Oshawa by car and

GO train. The car averaged 60 km/h, and the train averaged 90 km/h. The whole trip took 1.5 hours. How long was she in the car?

?
 time

	distance (d)	speed (v)	time (t)
CAR	60x	60	x
TRAIN	90y	90	y
Total	95		1.5

$$\text{① } x + y = 1.5$$

$$\text{② } 60x + 90y = 95$$

Isolate y in ①

$$y = 1.5 - x$$

Sub ① into ②

$$60x + 90(1.5 - x) = 95$$

$$60x + 135 - 90x = 95$$

$$60x - 90x = 95 - 135$$

$$\frac{-30x}{-30} = \frac{-40}{-30}$$

$$x = 1.33$$

Sub x=1.33 into ①

$$y = 1.5 - 1.33$$

$$y = 0.17$$

∴ she was in the car for 1.33 hr

Ex.3 A boat took 2 h to travel 24 km down a river with the current and 3 h to make the return trip against the current. Find the speed of the boat in still water and the speed of the current.

	distance (d)	speed (v)	time (t)
Trip 1 down stream	24	$y + x$	2
Trip 2 up stream	24	$y - x$	3
Total	48	$v = \frac{d}{t}$	5

$$\text{① } y + x = \frac{24}{2}$$

$$\text{② } y - x = \frac{24}{3}$$
